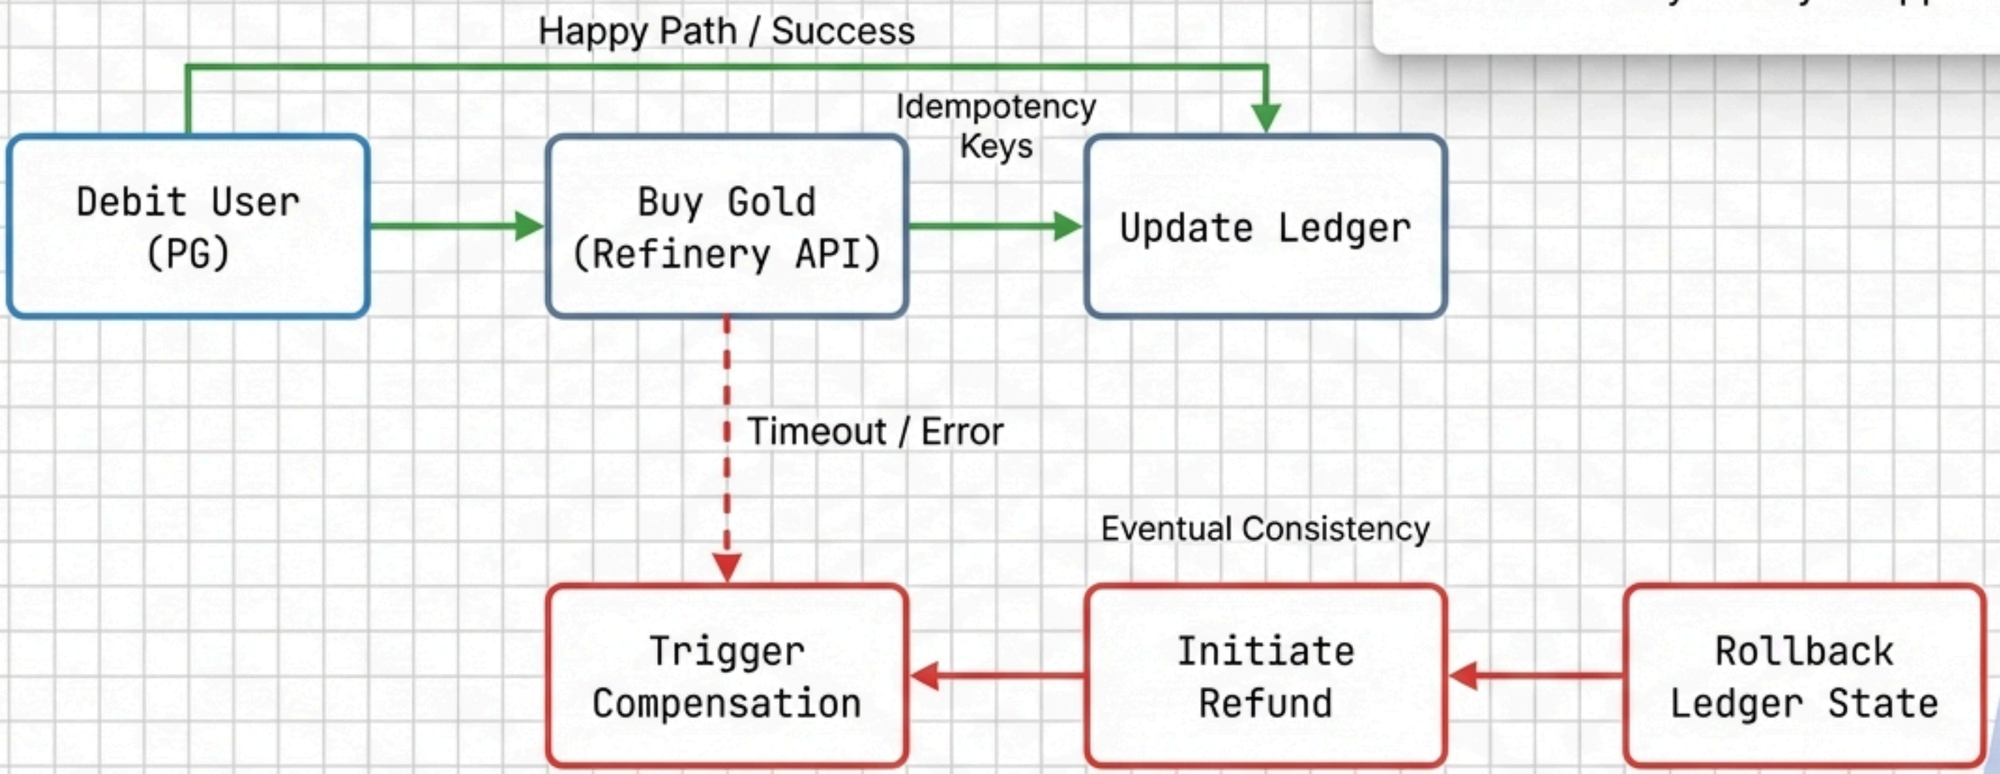
App Stability & Independent Scaling

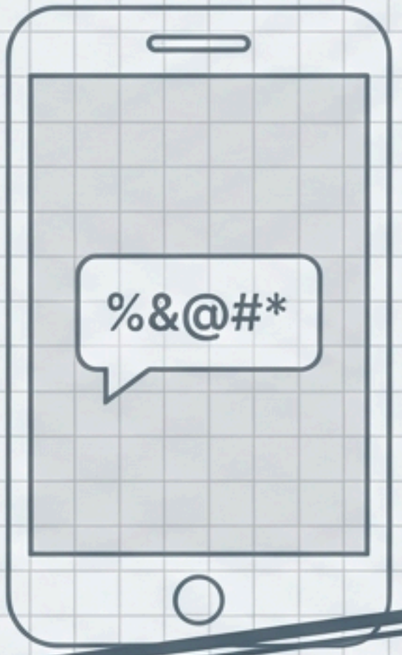
Why we survive IPL marketing spikes: “Vertical Slices” allow the Savings Engine to scale up instantly without dragging down the Lending or Identity services. Zero downtime for the user, even during partial system updates.

'Zero-Anxiety' Automated Refunds

We replaced slow database locks with the SAGA pattern. If a vendor API fails (e.g., Gold Refinery timeout), the system *automatically* reverses the money flow instantly.

Result: Higher user trust and a massive reduction in 'Where is my money?' support tickets.

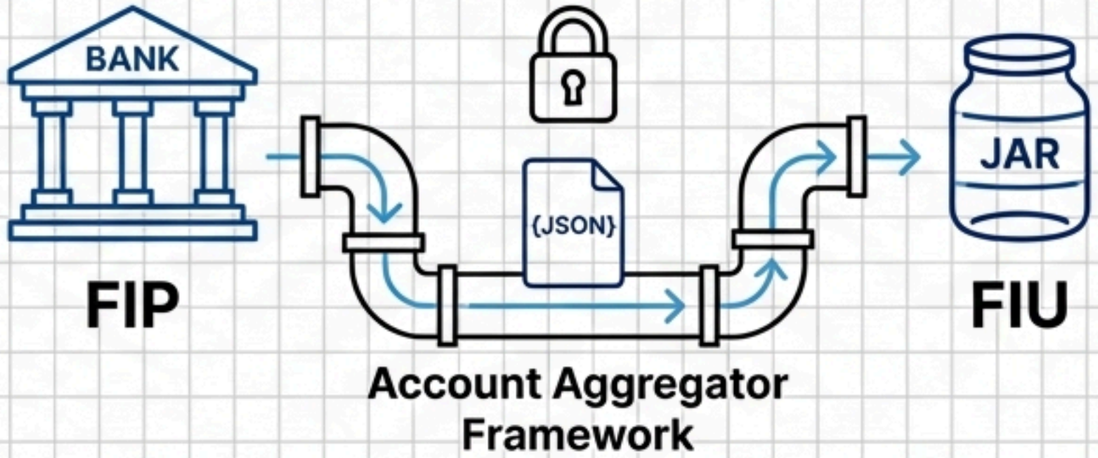




LEGACY: SMS PARSING

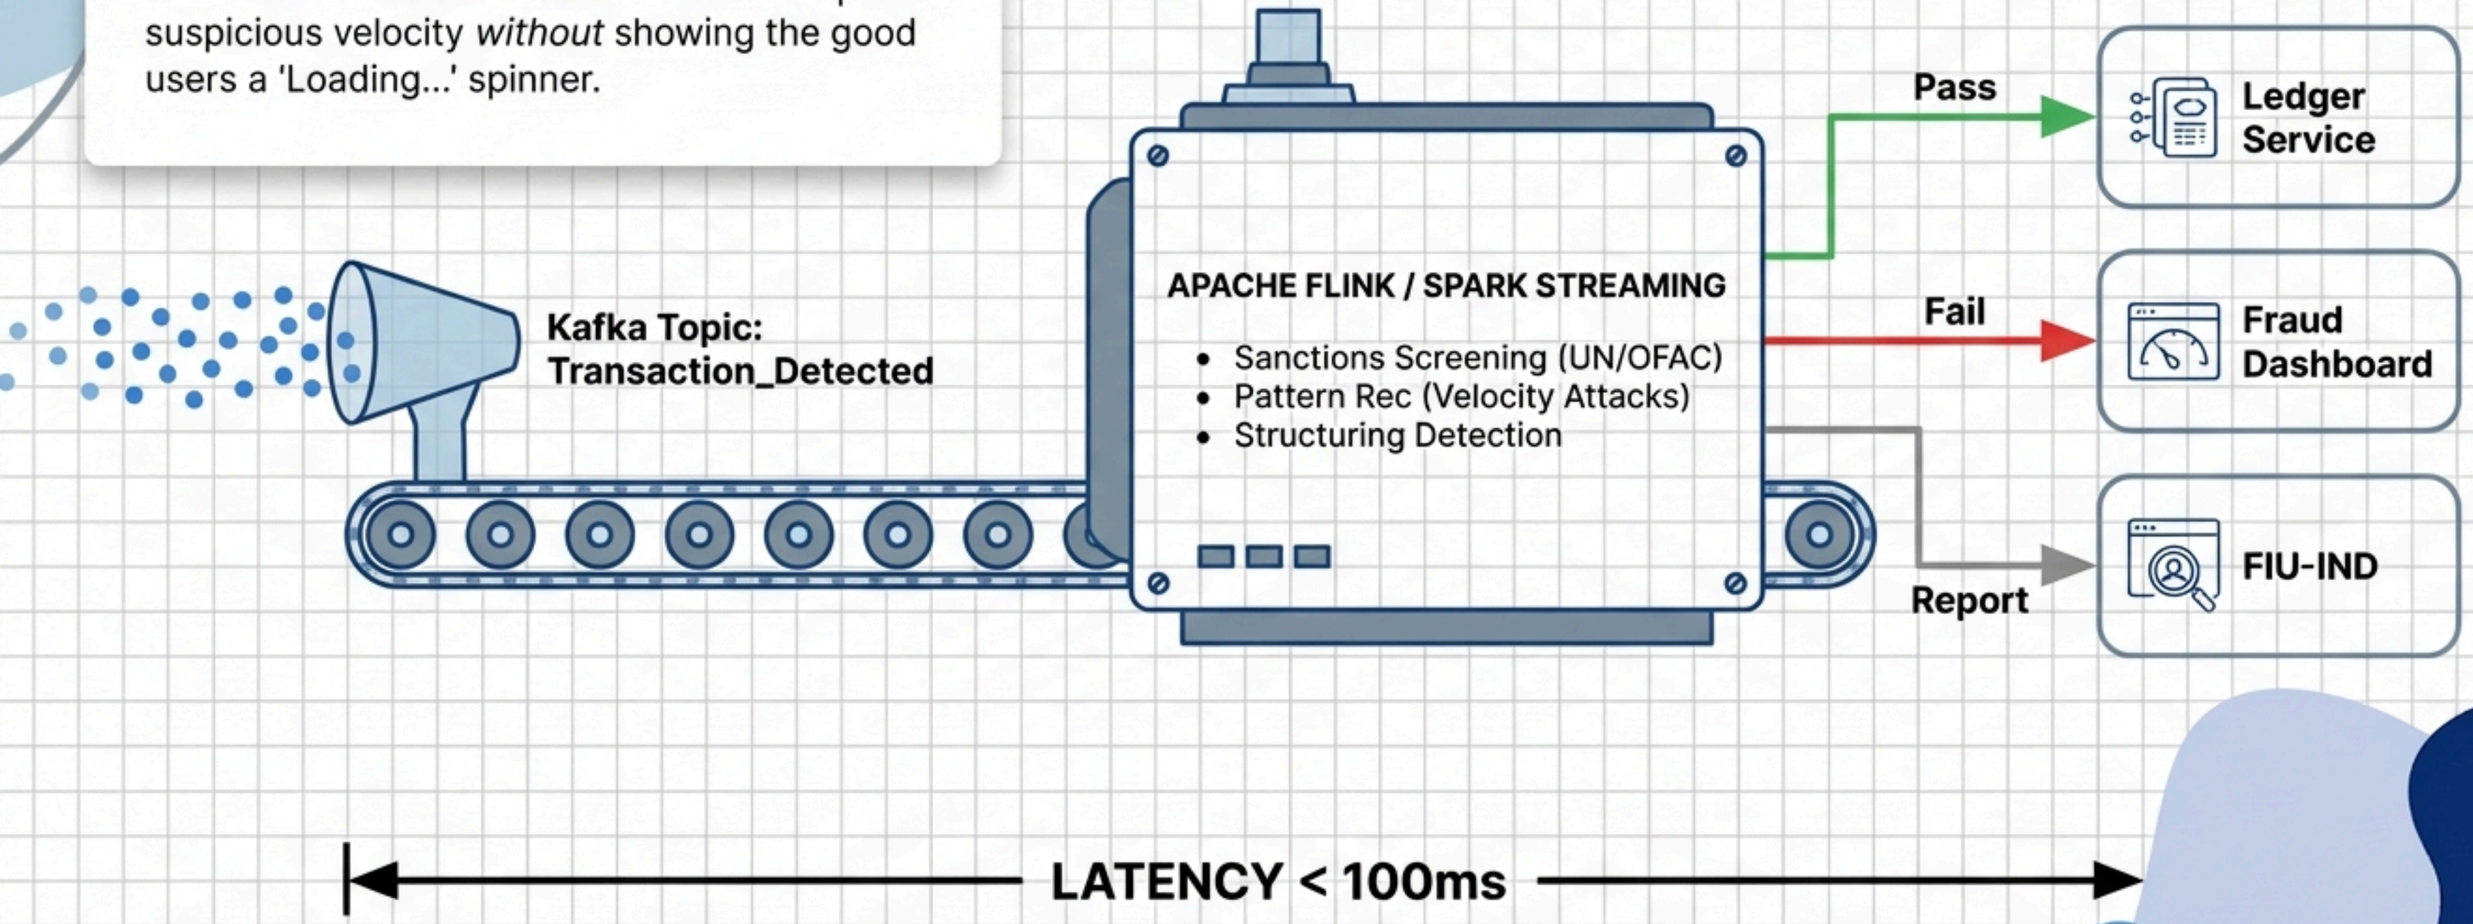
High Privacy Risk

Probabilistic



Frictionless Onboarding & Higher Conversion

We eliminated the invasive 'Read SMS' permission that causes users to drop off. By moving to the RBI-regulated Account Aggregator framework, we get deterministic financial data via a secure, consent-based flow. It's faster, safer, and boosts funnel conversion.

Invisible Fraud Prevention


Compliance shouldn't kill the UX. Our AML checks happen in the data stream in under 100 milliseconds. We block bad actors and report suspicious velocity *without* showing the good users a 'Loading...' spinner.
